Bike Sewa

1. Introduction

Now a day, technology is on a boost. People wish to live a luxurious life with minimum physical work. Here we provide a web application 'Bike Sewa'. This application is a web application that can be run on any browser. The proposed app will enable any bike user to search and communicate with a bike service center. The user can find the service center, book bike service provided by the respective service center.

The user can register/login, Online booking of bike servicing, send a request for pick and drop, view profile, check old service details, view parts price, online payment, get an email notification for servicing alert, doorstep servicing (minor fixing), give feedback, and send request for emergencies service.

Whereas the service center can manage both bike and user details and can manipulate those data and generate various records weekly and monthly basics such as the total number of customers, total income, the total number of bike servicing, total booking and cancel a booking. According to those data, service centers can offer various offers to customers, analyze business, and can increase revenue.

2. Problem Statement

The purpose of this project ('Bike Sewa') is to provide Bike Servicing more effectively than the existing system. There are some disadvantages of the existing service center management systems. These disadvantages are overcome by the 'Bike Sewa'. And it can be made handily available to every person. Previously people could not get help or locate the service centers conveniently in case of their bike break-down or any other emergencies. Thus, 'Bike Sewa' is proposed to assist people and fulfill their requirements easily.

2.1 Existing Problem

- Customer can't view old servicing details
- Customer can't book online for servicing
- Customer can't get emergency services

- Customer can't get email notification for servicing alert
- Customer can't send request for pick and drop
- Existing system is semi-manual and all work is done by paper and computer system.
- Only additional parts details can be viewed in bill.
- Records are stored manually regarding service.
- Existing system is time consuming
- Not user friendly.

4. Objective

- To store repair and maintenance data
- To improve customers' experience
- To increased efficiency
- To save the time
- To minimize the number of staff
- To increase revenues

5. Scope and Limitation

5.1 Scope

- It provides Customer to book for bike servicing online
- It provides Customer to send request for pick and drop
- It provides Customer to send request for emergencies service
- It provides Customer to view bike servicing record history
- It provides Customer to view profile
- It provides Customer to get various offer through email
- It provides Customer to email notification
- It provides Customer to servicing alert
- It provides Customer to 10x fast service
- It provides Customer to doorstep servicing (minor fixing)
- It provides Customer to make online payment
- It provides Customer to give feedback
- Service center can manage both bike and user details

- Service center can generate various data (total bike services, total booking, total income, total customer, total number of booking cancel)

5.2 Limitation

- It needs internet for booking
- Customer have to book even without seeing actually how service center looks like
- Sometime it may contain technical problems
- Sometime customer can be contactless after booking service

6. System Specifications

The Bike Sewa project is built in the java EE using the maven build tool following the MVC architect. As a back end, I am using MYSQL. And using tomcat server to deploy and run the application.

6.1 Software Requirements:

- Operating system: Windows XP or later
- Web browser (Chrome, Mozilla...)

6.2 Hardware Requirements:

- 512 MB of RAM
- Pentium 4 processor or higher

7. Tools and Technology used

The various system tools that have been used in developing both the frontend and the backend of the project are discussed below

Front End: Adobe XD 37.0.32.10, Html5, CSS3, JavaScript v8 8.9.

Back End: Java EE v8 (Jsp, Servlet.)

Server: Tomcat 8.5.

Database: MySQL 8.0.22.

IDE: Eclipse 2021

Version control: Git and GitHub

Methodology: Waterfall model

8. Architectural Design

The next phase of design will be planning the architecture of the application. There will be in some cases a separation of the user interface and data. The business layer will be totally independent and not embedded in the views of the website. Data will be stored in an SQL database. To query the database and code behind for server-side scripting will be in java EE. The other business objects will have their own layer. The architecture of the application is shown below in figure:

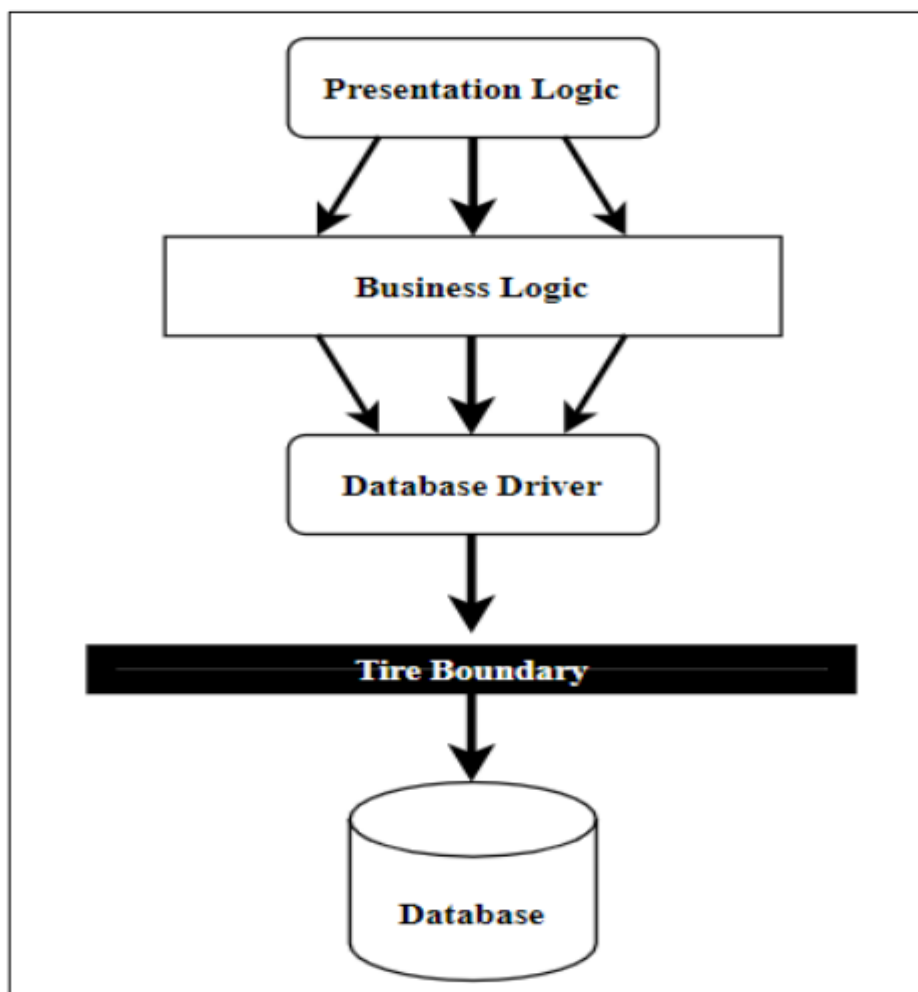

Figure 1: Two Tier Architecture

9. Feasibility Analysis

Feasibility study assesses the operational, technical and economic merits of the proposed project. The feasibility study is intended to be a preliminary review of the facts to see if it is worthy of proceeding to the analysis phase. From the systems analyst

perspective, the feasibility analysis is the primary tool for recommending whether to proceed to the next phase or to discontinue the project.

Feasibility studies undergo four major analyses to predict the system to be success and they are as follows

1. Operational Feasibility
2. Technical Feasibility
3. Economic Feasibility
4. Schedule Feasibility

8.1 Economic Feasibility

This study is carried out to check the economic impact will have on the system and on the organization. The amount of fund that the company can pour into the research and development of the system is limited. The expenditures must be justified. Thus, this project is economically feasible as the only cost involved is having a computer with the minimum requirements. For the users to access the application, the only cost involved will be in getting access to the internet.

8.2 Technical Feasibility

This study is carried out to check the technical feasibility, that is, the technical requirements of the system. Any system developed must not have a high demand on the available technical resources. This will lead to high demands being placed on the client. The developed system must have a modest requirement, as only minimal or null changes for the implementing this system. In order to design this system, it uses off-shelf and existing technologies, software and hardware so there is no technological hurdle to build this system

Bike Sewa deals with the modern technology system that needs the well efficient technical system to run this project. All the resource constrains must be in the favors of the better influence of the system. Keeping all these facts in mind we had selected the favorable hardware and software utilities to make it more feasible.

8.3 Operational Feasibility

The aspect of study is to check the level of acceptance of the system by the user. This includes the process of training the user to use the system efficiently. The user must not feel threatened by the system, instead must accept it as a necessity. This system uses simple technologies to design. So, it is user friendly.

8.4 Schedule Feasibility

This assessment is the most important for project success; after all, a project will fail if not completed on time. In scheduling feasibility, an organization estimates how much time the project will take to complete.

To calculate and continually reexamine whether it is possible to complete all amount and scope of work lying ahead, utilizing the given number of resources, within required period of time. In our project we used Gantt Chart for Schedule feasibility study.

Gantt Chart

Gantt chart is a bar chart that provides a visual view of tasks scheduled over time. A Gantt chart is used for planning projects of all sizes, and it is a useful way of showing what work is scheduled to be done on a specific day. It can also help you view the start and end dates of a project in one simple chart. In our project, we used Ms. Excel for developing the Gantt chart which is shown below in the figure.

Bike Sewa

Figure 2: Gantt chart of Bike Sewa

In the above Gantt chart showing the start and finish dates of a project's elements such as planning & requirement analysis, design, development, testing, deployment and maintenance. It clearly shows that my project will start at feb-2 (MAG-19), and take 15 days for planning & requirement analysis and so on till Apr-17(BAISHAK-4) I will finish design, development and testing. It will take 60 working days to finished my project. As we all know maintenance is ongoing process, so it has no time limit. Gantt chart helps in scheduling, managing, and monitoring specific tasks and resources in a project.

9. Conclusion and Future Recommendations

9.1 Conclusion

My goal is to create an application where any bike user can search and communicate with bike service center through online for their bike service and emergency services. The user can find the service center, book bike service provided by the respective service center. The user can send request for pick and drop, appointment for servicing as well as accessories purchase from the service center. The service center processes these requests and gives a response back to the user.

The current application has fulfilled these goals. We followed the specifications strictly but enhanced some of the features when there was need for it to be done.

With the goals achieved the basis of the application and this project has been achieved.

9.2 Future Recommendations

Here is what can be added in the future on this website to increase its usability, user experience and portability of the website. There is a lot to be done hence this application can be considered as a starting point for something big to come. It will need more time and resources for all these to be done but it is still very realistic and possible to achieve

- Add vehicle tracking for accident warning system
- Develop mobile application
- Can add Insurance for bike
- Renew blue book
- Add same service for car
